

Yonn Auchan Creation

INTRODUCTION

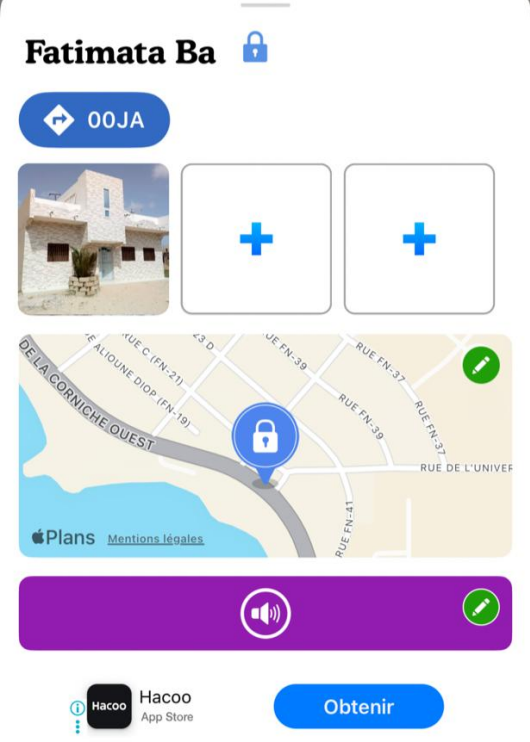

Auchan is a retail store here in Senegal, they also have online E-commerce activity. They are currently trying to better their customer experience because of delivery option. Here is what they asked from us:

- They already have the geographic geo-coordinate (latitude and longitude) of their users (over 10,000)
- They want to give us this data (name of client, phone number of client, geo-coordinate)
- They do not want to ask their users to create a yonn code, instead they want to operate internally only

WHAT WE NEED TO DO FOR THEM

- They will create accounts for their delivery drivers
- Drivers once they log into the Yonn app will only see the client locations, not businesses

	<ul style="list-style-type: none"> • Since the company is giving us the location, name and phone number, this will be displayed in client profile. • It will be their driver's job to complete the profile by adding the picture and the voice note.
	<ul style="list-style-type: none"> • Using the Catalogue option, driver's can put the name of the client and find their yonn code

PREFERENCES

- My preference is not to create a duplicate of the Yonn app but to have this information on our main app
 - Why? I do not want to have to pay for additional app fees (google maps, apple, aws etc) I prefer for it all to be on one app

- I would like to be able to see this information on the back end panel. Adding **User Type**. So that I can filter Auchan Yonn Users

- This is a type of offer we will make for different types of institutions so it must scale
- Notifications function must work
